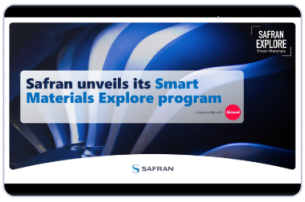
(DCR)Webinar Safran Explore - Smart Materials (A)Safran EXPLORE ...

國際 金工 · Today at 1:33 pm · 15 screenshots

Jawad Badreddine 0:10

Good morning, or good evening, everyone.



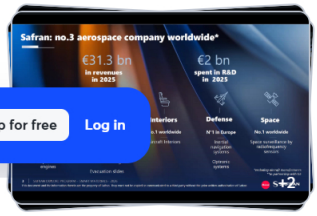
Steffen Harm 0:14

Hello, everyone. Hello, everyone. Welcome, um so if anybody has trouble with the sound, cannot hear us, don't hesitate to send a[n] . I will give the word to Jawad for an i[ntroduction], and to also leave some time for que[stions].

Get automatic meeting notes Sign up for free Log in

Jawad Badreddine 1:02

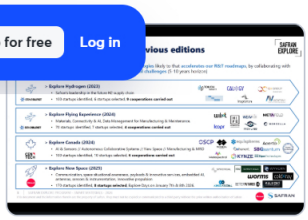
okay. well, welcome everyone. My name is Jawad Badreddine. I'm an open innovation manager at Safran Group, and I'm very pleased to be introducing this webinar session regarding the Spark Materials Explore program. It's an open innovation program that focuses on, I would say tomorrow's new materials and processes, and everything that goes around. We will address that in the coming slides, and the aim of today's webinar is to take some time to present again the program very quickly, and especially leave time for you to ask your questions if you have some, whether it's on the program itself, on the selection process, or any other question you may have, and I think we can, we can start. Maybe one little point, if you want, we will send to you the slides that you will see, just, just for information. The sl[ides] before this one, t[here's] know, Steffen or [I] video logo, very short videos that explain Safran as a company. In two minutes, the different activities, sectors we operate in worldwide, and another video regarding all our different products, and where can you find them on board of, for example, an aircraft. We also equip helicopters. and so on, but just to give you a broad idea, if you're not familiar with Safran, that's that's good. We can move to the second slide. Yes, so maybe very quickly, for those of you who are not familiar with who we are, Safran, we are number three aerospace company we operate worldwide. We are a major equipment provider and we operate on, I would say, five different types of equipment first of all propulsion, whether it's for aircraft or helicopters, critical equipment for aircraft and helicopters like landing gears, wheels, and brakes, wire, electrical wiring, evacuation, and safety equipment. We have also activities regarding interiors, whether it's cabin, the seats, the trolleys, the toilet within the aircraft, and all these kind of equipment, we also have activities within Defense as an equipment provider, not a system provider. And finally, but not least, on space activities, [we] We can move to the next slide. Yes, ar[e] of 2025 probably a little bit more today. We are on a very ramp up in terms of staff and growth, we are recruiting about 18,000 people per year this year and in the coming years for information. Half of the staff is in France, but as you can see, where presence is also existing within Europe, North America, North America, Brazil, but also in Asia, so we have China, Japan, India, South Korea, Australia, New Zealand, and so on, Indonesia. Sorry, not New Zealand, and we have either production. We also have in these areas we have R and D production sites, maintenance sites. Also, next slide, please.



Get automatic meeting notes Sign up for free Log in

Jawad Badreddine 5:07

Yes, before mayb[e] is the topic of toc[ay] the fifth edition. We've already done five other explore programs. Every program we launch has a specific topic that changes, so this, the slide, I will not go in detail for each one of them. If you have questions, we, of course, regarding them, we can ask them in the Q and A session, but as a global idea, we for every program we have at least one or multiple sponsors within Safran business units, we identify the needs and the topic with them, with their experts, with the sponsors, I would say the management, and then launch such program to identify between five to 10 laureates with whom we would like to cooperate, and just for giving you a very quick example of the first one we launched in 2023 Most of the companies you see that are the laureates from the program, we are still in touch with them, we still cooperate with them, and some more or less, so these programs I would say, and if you are a laureate, and we launch a puck together, the puck itself is only the b[eginning] [f]or a one shot pox, but it's - we see it as [a] [p]lease.



Get automatic meeting notes Sign up for free Log in

Jawad Badreddine 6:54

Yes, so regarding Explore Smart Materials. So, this is, as I said, the fifth edition. The focus is mainly on materials and processes, so the old process manufacturing processes, but also maybe NDT monitoring processes that can, that are related to them, and maybe I think we can go directly to the next slide, because most of the information I've talked about, yes, so in this program, as for the previous ones, they are, it is, how to say, articulated around five technical challenges, five main technical challenges, I will not detail them here, they are very well detailed on the on the program websites, which you can access well. We will provide to you, but even through the slides

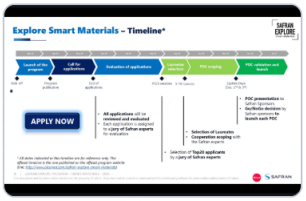
Get automatic meeting notes Sign up for free Log in

ite. But to give you a broad idea, the fi say bulk materials, but also surface so ditive manufacturing, or new ways to do additive manufacturing, but not only. Okay, these processes can can go from from surface solution processing, or also bulk material processing, anything that could give us, I would say, allow us to have maybe better productivity, better performance. Keep in mind, in aeronautics, and what we do, safety and performance is really the priority number one. So, anything that can allow our materials to perform better longer in terms of lifespan and time, that that's also some things we will look for, and of course sustainability, so more I would say sustainable also materials or alternatives to what can exist today. Challenge two is maybe like I can say the digital twin to some extent of challenge one. It's how can we use AI and other numerical techniques to design new materials, new material systems, and new material architectures to enhance either the performance of existing materials, that's for example material architecturing, or really invent, discover new combinations of materials, whether it's only metals or polymers or ceramics, or a mix of all of these to have better performances, and yeah, better performances of our materials

J Jawad Badreddin

Get automatic meeting notes Sign up for free Log in

for challenge thre ns, that's very a very specific point, because aeronautics is there's a big transition towards more electric electrification of airplanes, we already see it today, and it will accelerate more, and with the current crisis we see in the world with the energy and so on in the Middle East, it may also help accelerate that. So that's why it's a very important focus for us in terms of R and D and developments. For challenge four, we are focusing on Circularity and recycling, we have very specific, I would say, topics that are priorities for us. One, the first one is Circularity for critical metals. In critical metals, we can find, for example, titanium, cobalt, or other metallic components, rare earths, so anything that could help us that we use basically to create our products, but are either subjected to geopolitical tensions or, you know, being more scarce in terms of natural resources, like for example copper, we know in the coming year by 2035 the de demand will be much, much higher than the actual available new resources. So, all of that is included in this topic, a very specific topic on recycling carbon fibers. The aim for us, and this is important, the aim for us is we use, for example, very high quality carbon fib arts, and from production we ho ng fibers, still not continuous, but st an process these fibers, be able to reintegrate them and recreate. I would say aeronautic grade components, maybe not the same as the initial source as critical, but still aeronautic components, because today we do recycle our our production waste, for example, but all the I would say products that are generated from them don't come back to aeronautics, because they are not very performant and not worth, not air worthy. So we are looking for solutions that can allow us to have a closed loop circularity, so from our waste recreating parts for Safran. The third part is really focused on I would say recycling hybrid materials. Hybrid materials can be basically composites, ceramic composites, organic composite, metallic matrix composites, or any other kind of of materials we we can use in the aeronautics and the last one of this will put some some effort on that is material traceability and risk management so the first three are really I would say process physical solution the fourth one is more software solution. We are looking for so software solutions that allow us to have material traceability along the life from the design to the end of life of our parts, knowing what exactly we have put in that, following that in time, if there are any changes, also being able per part and per reference, but also linking that to reg ix, for example, in all the whole industr e it is dangerous and toxic, become forbidden to be used, so in these cases, if having such database can help us directly or much faster identify which are all the parts that are concerned by this change of regulation, for example, and then be able to treat them accordingly, and I finish with this slide with challenge five. No, if you can go back just to the slide before, and the challenge five, so it is focused on.



P Pauline De Rodell

Get automatic meeting notes Sign up for free Log in

Sorry, there is tho

J Jawad Badreddine 14:23

No problem. So, challenge five, we focus on process monitoring during production, but also for ARMR, also for inspection and mai are looking for portable and por n, so we spent at least the least am ce shops for

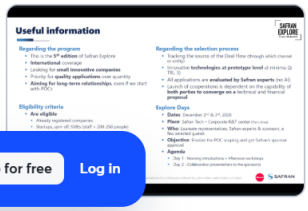
Get automatic meeting notes Sign up for free Log in

inspections, and being able to do quick inspections, and so on, under the wing, so we can, I mean, if the part is still okay, not necessarily have to disassemble it, so gaining time, and that brings a lot of value to our customers for the process monitoring, and I'll finish with this, it's most what we're looking for is really in situ solutions to monitor complex processes like additive manufacturing or other like heat treatment or processes where the conditions of manufacturing are very extreme, so we can monitor the the how the process is going, see if there are any, I would say differences between the reference and if so being able to correct that, for example, live on the go, or if we know that the issue that happens, we cannot correct it anyhow, while being able to stop, for example, the job, instead of continuing, for example, the build of the part that will never be air worthy, so that's basically I would say a very macro, the main five challenges, the sub topics they are, they are the, they are that structure them, and on our websites, and also in the appendix of this slides that we will share with you, there is much more detail for each subtopic of what exactly we are, we are looking for. Next slide, please.

Get automatic meeting notes Sign up for free Log in

Jawad Badreddin

Yes, another important information to provide you is the timeline, so the program has been launched on april 22 has been published the application. So today we are in the call for applications. It will end it in june 5. For information for the applications, it's not a report or anything in terms of efforts from your site. We were very careful to take that into account. From our website, you have an online form that you can fill in, so either with some list of answers you can select, or just plain text that you can, you can provide basic information about the company, the technology. If you have any cooperation with Safran, for example, and maybe you're like, how do you see the relationship with Safran? And what would you like us to cooperate on? What is your added value, for example, compared to other other companies, maybe similar companies that exist, and in the end providing do nformation, of course. As at this stage, t evelop new materials, and you ecause after the application is closed, so again, I think for applying it should take maybe 30 minutes, one hour, so it's not a very long, very long time, and we try to make it as short for you as possible. And after this, we will have an evaluation phase by our experts, the same expert that helped us scope and define the different challenges and sub topics and needs. So, when you apply, you are sure that you will be seen, and your application will be read by all the different Safran experts that are relevant to your topic, and you can, of course, I showed you, know you have different challenges, different sub topics, you can apply to multiple ones in the same application, so one application, and you can select all of the different topics and sub topics you are, you think you can bring value to Safran, and we can create value together, basically. So, yeah, that's important. We are not using any AI or anything to pre-filter or analyze your applications. It's really our experts and natural human brains, if I would say that, will see that and will evaluate your, your application. And by September, we, before September, we will select a top 20, top 30 startups we would like them to pitch to t whom we want to cooperate and la the laureate sign an NDA each one of ne cooperation, whether it's technically, but also commercially. Behind the bulk, there's a purchase order, that's the idea. We don't ask you to work for free, it's a small project we do together. The idea is to have a short enough project, not very, not too expensive, I would say, in a way that we can very quickly, in a reasonable amount of resources, evaluate your technology, evaluate how we work together, and see if we can, if the technology can fit really into our roadmaps and product roadmaps, and if the answer is yes, then it's, you can say this is the first step to a more, I would say, long-term relationship, together with all the TRLs that we can do together, and other developments, and with other contracts, and discussion with regarding IP, and so on. I think I'll stop here for this slide, and of course, you probably will have some questions, and I'll be happy to answer, answer them. Yes, we are almost done for the presentation. A few useful information,



Get automatic meeting notes Sign up for free Log in

Jawad Badreddine 21:14

yeah, maybe one thing. So, I will repeat it again. We really are aiming for long-term relationships, even though the first step is a POC. Okay, we are looking through this, these programs to identify, well, first of all, accelerate our RD roadmaps, not by taking the technology from small players, but developing new technologies with the small players. Okay, it's a win-win situation, or at least that's our mindset, and, and trying to find tomorrow's, you know, key partners and key suppliers. What else can I say? Yes, one important information I forgot to mention in the previous slide, but I will say it here is the Explore Days, so at the end of the process, once the POCs and the cooperations with the Laureates are clarified, are scoped on december 2 and third, we usually, so in these programs, organize what we call Explore Days, where we bring physically together representatives from the Laureate startups, our experts, and our sponsors in one of scoping, and so on, and especially pr cial scope is approved on that nch already the purchase orders, if in some cases, because, because it can happen, the technical, I would say, scope is validated, but the budget is maybe too much for what we can pay and finance ourselves. It's not necessarily a no-go, but it means that we will have to work together to find some public funding to complement and being able to fund the whole project. For the funding, we don't aim to get it ourselves. The idea, if you as a startup, you can get the funding, and we complement with the budget we have, and we can be able to do the project, that's that's very good for us, and usually we try to organize maybe a site visit or so, so this is not yet confirmed where or what, but yeah, we will try to do that next slide, please.

Jawad Badreddine 23:50

Yes, and I think this is the last.. I think, yes, I think this is the last slide. It's just a highlight fro

Get automatic meeting notes Sign up for free Log in

new space sector
We selected 22 st

Among the eight today, we have already a few of the POCs that have already been launched. Some others, as I mentioned, the budget is a bit too much in a way, but we are looking for, with the startups, to look for funding, and we, it's going quite well. So we are very confident that all the others that haven't launched yet, we will be able to launch them by during the year, and a very small picture of everyone that was present, and that braved the snow in January, and I think that's it for me. I'd rather keep a lot enough time for you to ask your questions, and, and to discuss. And thank you for,

Steffen Harm 24:55

thank you. Yeah, thank you, Jawad. Maybe just, if you can go back to the previous slide, Pau

maybe you were,
to startups and s
know, big companies, so it's dedicated to small companies. If you are, so of course SAFRAN is working a lot in the aeronautics. If you are today not working in aeronautics, that's fine, that's not a problem. So the applications are open to to any, any company that has an interesting solution to one of the challenges, and in terms of of TRL, or of where you are at with the technology we are looking, it, we don't have a specific criterion, except that we're looking for something where there's at least some kind of pilot or demonstrator or prototype or something that can be tested, so if today it's just a theory or PowerPoint slides, then it's a bit too early stage for this program, but any technology where there is at least, you know, something that can be that can be tested is relevant for so I like, as Pauline put in the chat, we have some time left for questions, so you can raise your hand or or send the questions in the chat as you want. I do see one hand raised already, so yes, please go ahead.

Nikhil Dakoju 27:

Thank you, Stephen, and thank you, Jawad, for the lovely presentation. I hope I'm audible. Yes, this is wonderful. Yes, so why you did give more detailed insight with respect to what the challenge was. My question is from Safran's perspective. What is currently the bigger gap that is preventing adaptive smart material systems from reaching deployment readiness? Is it the material capability themselves for the lack of integrated validation platforms that are capable of evaluating them under realistic conditions.

Jawad Badreddine 27:48

I would say there's nothing really today preventing it. We in Safran, if just before answering completely your question, in terms of innovation and developments and R and D, we address the topic in two parallel streams. The first one is the internal stream, so we do ourselves develop new materials, new processes, new products, and technologies, whether fully internal or with the help of academia and research centers and technology centers, but we also do innovation like th smart and smart people and brilli ou know, partner and go even further tha on developing that. It's a, but the only thing I can say is developing and integrating new materials in aeronautics in general is a very long-term process. Sometimes it can take up to 15 years before you know the very first first test until we actually, you have a part that is certified and flying. Remember, again, it may not be true for other sectors, but in our case, every materials we put in on a plane, or any other subsystem, for example, the engines or anything, they are critical, and safety is really number one priority, so we really need to be sure that we know everything about that material, we know everything about its failure modes, whether internal, whether it's from the environment, and so on. So this requires a lot of testing, a lot of resources, a lot of resources in terms of human resources and budgets. So this what makes it usually a long process, but it's something that we do continuously since, since many years. I don't know if it fully answers your question.

Nikhil Dakoju 29:

Yes, yes, that doe t. So, so, so, you see the future collabo ps capable of bridging material integration control architecture and aerodynamic system validation together? How does it?

Jawad Badreddine 30:16

I think it's, it's probably a mix of both. In reality, I mean, in any new program we have, like, we are working on the Rise engine, which is, would be the next generation. It's a, we are, you know, like skipping one generation to get to this, to this new engine. For information, it's in-house development. We do it with General Electrics, in terms of a joint venture, but the final engine, the final product that will be out, some of the designs, the materials will be ones we have developed ourselves, or we have ourselves, and in some other cases, there will be technological bricks that we can be able to to bring into, into this program. I'm just giving that as an example. There's not only, only this program, so both I would say both, both are existing, and both are necessary. As I mentioned before, we, we can maybe do a lot of things, but in som worked on this topic, or this materials, han us, and we also acknowledge tha you is interesting, because it allows us, us to go faster, further than if we did everything in house and at the same time for you it's also an opportunity business opportunity and development opportunity to enter either a new sector or develop other other customers.

Nikhil Dakoju 31:53

Thank you. Thank you so much, everyone. You're welcome. I

Jawad Badreddine 32:02

see that there is a question in the Ano that was you, Pauline. Sorry, do not hesitate to ask your question, either, either you know by voice, or if you are more hesitant or shy or anything, don't hesitate to write it in the chat, and myself, Pauline, or Steph

Get automatic meeting notes Sign up for free Log in

Steffen Harm 32:2

Maybe I will go through some of the frequently asked questions that we've had, that we've had in the past. Some of them we already talked about, but nevertheless, I will just go go over them quickly.

Jawad Badreddine 32:42

Steffen, there is someone that asked a question. Maybe, maybe I'll answer it, and then we move to go ahead. Okay, please. So, the question is, can you elaborate on funding if the budget is beyond the planned one? Yes. So, regarding the, regarding the funding, I will not give a target today, because it, if I check from the past experience, we've had sometimes POCs for 10 case speaking in euros, and sometimes for 250 case. Okay, it's really then the scoping and the poc is defined based on the need we have the and also your technology and what it requires to actually test it, evaluate it as a first evaluation before moving forward and doing any TRL level maturity and so on. What I can say regarding the fun is we will know it already in advan scope is defined, once the budget and th ther it's a budget as one whole, because it's one work package, and we cannot divide it. We cannot resize it down, because it will not make sense. In that case, we will work hard to find, and you probably also have within your ecosystem, find different agencies that are able or willing or can fund either one or multiple agencies. We have done that in the past, and we will do it also again. In terms of Safran, we are also connected with governmental agencies, I think, for example, Japan or Korea, or even India, for example, we have also a lot of very strong relationship, so it's the idea is everyone can use the leverages and the networks they have to be able to make this book come true, so that's for the if the budget is beyond, and in some cases the budget is beyond, but we can maybe cut it into multiple work packages, so we start with one and do a go, no gos, so it allows to spread it a little bit more on time, and make it, I would say, being able to launch it and start something on more short term, so that's different ways to, to do so. I hope I answered the question. If not, don't hesitate to tell me. I think there are also another question.

Get automatic meeting notes Sign up for free Log in

Pauline De Rodell

Yes, there's two o you answer them.

Jawad Badreddine 35:38

Okay, let me know for challenge two, so the question is, does SAFRAN prefer platforms that propose validated experimental candidates, or in Silico prediction with thermodynamic consistency sufficient for a POC? We will check both. Actually, the what we want, as I would say, like a final customer is is a reliable tool, so sometimes to get to that tool we need some physical data. Sometimes also we need, you know, thermodynamic and physics that inside and mixing both can even help us to go beyond. So, if you have one or the other, or both, please apply. It's really an important topic for us, so and it's really an interesting and important topic for us. So, I hope that that answered the question. And there was another.. no. So, that was the first question.

Get automatic meeting notes Sign up for free Log in

Steffen Harm 36:31

Yes. The second c complete if you, if you want, so the n NDA for the application, so please do not submit highly confidential information in the application form, but then if you're, if your application is selected, then of course we will set up an NDA, and then, and there was also part of one of the FAQs, the idea of the POC, so if you're selected, if everything goes well, the idea of the POC is not to generate new IP, in most cases, most of the time it's really about seeing how your technology could work for the environment that SAFRAN is working in, if in some specific cases the POC requires to generate some new IP, then this will be a part of the negotiation at that point, but most of the time, or the goal is not to generate a new IP in the

Get automatic meeting notes Sign up for free Log in

Jawad Badreddine 38:10

POC, and maybe if I can complement what Steffen said, we are not looking to take, I mean, I know, I know it can sometimes be the case with other big corporates that they will see small companies, as you know, a little prey, and they can take that potential partners. So, as Steffen said, m POC is just testing what you have o ata, well, since we purchased them, it belongs to us. But the technology, the IP that you have developed for that, remains yours. That's there's no question about that, we don't aim to take it or anything like that, and as Steffen said, either if in the case for a poc there, because it does not make sense otherwise, there is some development needed, and we both agree on that. Then, before launching anything and any purchase order, this has to be negotiated and clarified, I would say, legally within the contract, beyond the NDA. So, once the cooperation is launched and the POC is launched, this is something that has been clarified and is clear, and in the case, if the POC does not require any IP generation, as we've mentioned, but and everything goes well, and the next step we say, okay, well, now we know it can work, we know it is really interesting for us. Then we want to, you know, co-develop, now go really step forward and put more effort, then probably there will be IP generation, and in this case, again, like what I said previously, this has to be discussed before launching anything, so it's important we are very careful about that to protect our own IP, but also in order that you protect our your own IP and we go into a win-win and a healthy, I would say, and trustful relationship. Otherwise, it will never work in ered the question.

Get automatic meeting notes Sign up for free Log in

Jawad Badreddine

Yes. Continue with the list of questions.

Steffen Harm 40:42

Yes, yes. So, the first question, most important, we already talked a bit about it, is you know how to apply, and, and how to, how to select the challenges or the sub topics that you want to apply to. So, again, I'm really insisting on what Jawad said already. If you think that your technology could be interesting for one or several challenges or sub topics,

don't hesitate. There's no risk. It takes, like Jawad said, it takes between, yeah, I would say 30 and 60 minutes, so in the worst case you have lost 45 minutes of your time, but if you think this is relevant, then we are very interested in reading your application, so please don't hesitate to apply if you think it's relevant, so you can go, you can go on the website. I will also maybe put, just in case, the link to the website, even though you, you probably went through the website to apply

Get automatic meeting notes Sign up for free Log in

itating between challenges or sub be disqualified from one challenge because you also apply to another challenge. If that makes sense, so if you have, if you, you know, if you have a doubt, should I apply to this challenge, or to this topic, or to this topic? You can select both, and, and it would not, you know, one does not disqualify you from the other, of course. Try to do it in a way that makes sense, so don't just select all of

Jawad Badreddine 42:45

the, all of the, all of the challenges, but yeah, don't, don't hesitate really to apply, and don't hesitate to select all the topics that that you think your technology can be relevant for, and if I can add something behind these five, behind these five challenges and sub topics, and so on. They are in the end, it's 49 different sub topics that are of interest, and in front of each one of them we have a list already identified, list of experts within SAFRAN that work on these and are the ones that know the needs and the applications. So, as Steffen said, if you apply to two or three sub topics, for example, you for r application for that topic, and for the

Get automatic meeting notes Sign up for free Log in

Pauline De Rodellec 43:40

and may I add one thing about the application. It happens sometimes that you have multiple solutions that can be a good solution for different topics. If it's the case, do not hesitate to submit multiple applications, one per specific technology with specific program, because the experts reviewing your application knows precisely the challenges you are, you have applied it. They can also exchange applications if they think that it's more relevant for another challenge, but it will help a lot, the the the evaluation if the application is really with the technology in your application, is really for the challenge, but as Stephen said, also it's if you have a doubt on which challenge is the b

Get automatic meeting notes Sign up for free Log in

Steffen Harm 44:4

yeah, don't don't hesitate to take multiple challenges for if you're applying with one technology, if it makes sense, but also don't hesitate if you have multiple technologies, different, like radically different ones. If it's just a small variation, then you can send one application, but if you have two or three radically different technologies, then you can submit two or three applications if you want. There's another. There's another question. Yes,

Jawad Badreddine 45:17

yes, I can read it. Will the solution for SAFRAN restrict the company from providing solutions to another customer. I guess the company is being the you guys, the startups. So, by default, I would say no. It really depends on the strategic value of your technology, and so on. In the first stages of the poc, the answer is clearly not, but if we move on later on in terms of development, maturation, aiming to make it a product, whether it's in our production facilities or on our products that fly, e to case discussion, but in that case, i s has to be discussed and negotiated w s, so if this, if this topic comes up, we will have this discussion before and not go developing for like five years, something, and then in the end say, oh yeah, by the way, I want it to be to be exclusivity for Safran, and I don't want you to sell it to any other customers, if that makes any sense. So all these topics are very important for us and are usually some of the things, if we don't address them early in the early stages, can actually make a project fail. So that's why I am answering. Also, in this way, it's the IP. If there are any, any, how to say restrictions or concerns from your side or anything once, if you are selected, of course, as laureates, and when starting to discuss about the POC, and what are the.. if the POC is successful, we will, with these experts, list the criterias, so we can have an objective way of evaluating from both sides, and also anticipate what would be step two, step three, for example, towards maybe a commercialization, and so at this stage in the scoping, these topics has have to be addressed at least, and

Get automatic meeting notes Sign up for free Log in

Steffen Harm 47:33

also know that, o rse SAFRAN is selecting the best u know, if at one point, or even in the early stage, if at one point you want to retract, you can, of course. There's no legal obligation if you submit the application. There's no legal obligation for anything. So, so everything, everything can be, can be negotiated. Yes, I

Jawad Badreddine 48:28

Anyway, we stay available, of course. If you have any other questions with Steffen, put in myself, and on the website there is an email, specific email. If you have any questions, and so on, don't hesitate to contact us through that. I don't know, Stephen, if there was another,

Steffen Harm 48:48

another question t ekend or over most of it, so what's at st

Maybe, maybe I can, I can say one thing, because this webinar session, we try to orient it mostly to the Asian startups. We are really, really, really keen and interested into discovering the Asian ecosystem, whether it's South Korea, Japan, India, it's places where we operate, but SAFRAN is relatively an Oxy-like European company. It's well known, I mean, is known in the US, and so on, maybe a bit less in South Korea and Japan and India, and we are very interested

known in the US, and so on, maybe a bit less in South Korea and Japan and India, and we are very interested, actually, in discovering the ecosystem and actually launching cooperation and developing things together. So we will personally, and I think all the staff and our management will be very, very happy to to have applications from from your countries and from you, and for information, we analyze and evaluate all the applications, really, without, without any, any how filters, so your application will be analyzed the same way as if we, as, as for example, a French application, or whatever, it's really the best technology is the best fit that will be selected. Okay,

Steffen Harm 50:

I think if there's n

Yes, maybe after, after the meeting, we can send an email to all the participants, because I have noticed some have already disconnected in the previous minutes. We can remind them with the link for the website, we can provide them with the presentation we have presented, and remind the, as Pauline did in the chat with the contact email, if they have any, any more questions or that.

Steffen Harm 51:12

Definitely, yeah. So, don't, don't hesitate. Yes, please.

51:18

Yeah, it's both, ye

lected, you provide us with comments o

Jawad Badreddine 51:34

we can. Yes, we can. We can do that in for information. The during the evaluation phase, we have, we will, we will have maybe five, six different criterias on the technical aspect. The team, is it solid, is it on the business model, on the technology, and so on. We have like a rating between I would say five one to five, but we also, for these experts, there's a place where they can put their comments, and so we can. Yes, we can provide that after. Yes. Okay. Thank you very much. Yes, you are welcome. And maybe one last thing could be interesting. This is something we have seen in the previous programs. Sometimes you can apply, maybe you're a bit still a bit too early stage, or your technology - there's today not a specific need for it within Safran. It doesn't mean it's not interesting for us, but today we don't see where we can use it. It happens a lot that companies that were not selected for the laureates, okay? After a few months, and so on

ay an application is found that there's ontact them, so applying, and eve ble to all of the SAFRAN experts beyond the ones that also evaluated for information, so

Steffen Harm 53:30

Okay, I think, yeah, we can, we can wrap up, and if, like, like Pauline and Jawad said, don't hesitate to send us if you have additional later on. All right. Thank you very much.

Jawad Badreddine 53:54

Thank you very much. Have a nice

Steffen Harm 53:56

day or evening. Ye

Jawad Badreddin

and hopefully see you at the Explore days, because you are a laureate, so

Pauline De Rodellec 54:07

well. Thank you very much, everyone. And I'll send you, of course, the slide deck presented, and also all the information for the application process in an email. If it's today, or if it's not today, would be tomorrow, so tomorrow. So if you be happy to tell your application, of

Pauline De Rodellec 54:27

course. Thank you very much for your time
